                                                                                                                                                                                                              The SKC-2 gene was isolated from S.equisimilis type C by gene amplification from the synthetic primers SK1, SK2 and SK3 (see AAQ20666-8). The SKC-2 gene was inserted into yeast expression vector PBS-7 for extracellular expression of streptokinase and into pNAO for intracellular expression in yeast. For expression in bacteria, the SKC-2 gene was inserted in plasmid pEKG3, between a trp promoter and a T4 terminator.

indepression to the control of an activation in a pharmaceutical composition comprising alloaded clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase; (3) an expression vector comprising (1); and (4) a host cell transformed with the expression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator; is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase can also be used in non-human mammals. Streptokinase condition of plasminogen is at least 10-fold, preferably 100-fold graeter in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least none amino acid substitution that intendification classified streptokinase has at least none amino acid substitution that intendificated represents native streptokinase at least two-fold. The present contended to the streptokinase at least two-fold. The present contended to the streptokinase at least two-fold. The present contended to the streptokinase at least two-fold. The present contended to the streptokinase at least two-fold. The present contended to the streptokinase at least two-fold. The present contended to the streptokinase at least two-fold.
    present invention describes an isolated bacterial protein that

New polypeptides which bind streptokinase-specific antibodies useful in thrombolytic therapy Disclosure, Page 12, 44pp, English.

```
The present sequence represents a native streptokinase. The specification describes a polypeptide which binds to a streptokinase-specific antibody and prevents the antibody binding to native streptokinase. The specification also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProS8-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence represents native SK. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPIG) to plasmin (HPIM), which is a serine protease able to catalyse the plasmin (HPIM), which is a serine protease able to catalyse the agent in the treatment of vascular thrombombolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the KS9E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.
                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                           Streptococcus equisimilis H46A, streptokinase, mutant, fibrinolytic, plasma clot, hydrolysis, haemolytic Streptococcus, plasminogen, plannin, serine procease, fibrin, blood clot, thrombolytic, vascular thromboembolytic symptom, acute myocardial infarction,
describes a synthetic polypeptide (P1) comprising an epitope which binds to an streptokinase-specific antibody and reduces thrombolytic activity of streptokinase. P1 is used in thrombolytic therapy, and to prevent or treat glomerulonephritis and rheumatic

The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProS8-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence is mutant SK K195E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolygis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.

The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein, (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of the SK protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells of a given species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

This sequence represents the human Streptococcus equisimilus streptokinase protein sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between plasminogen activator (PA) comprises a polypeptide fusion between careful activation are apable of plasminogen (FG) activation, and fibrin binding and so or land 2. The hybrid PA possesses the ballity to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable and pronounced duration, or lag, after exposure of the PA to a suitable candious are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen activation thous aiding in the call activation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation cencountered during clinical use of streptokinase.
                                                                                                                                                                                                                                                                                                                                                               Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin binding domains of human fibronectin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 30; DB 21; Length 414; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cell epitopes) of the given species, and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immunogenicity of the protein when exposed to the immuno species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunoglobulins or therapeutic protein? Streptokinase (SK). The products can be used for diagnosis and therapy. The present sequence represents the amino acid sequence of a de-immunised SK protein molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ·.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         invention relates to a method for the production of non-immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Streptokinase; SK; hybrid plasminogen activator; fibrin binding region; plasminogen; human; fibronectin; thrombolytic therapy; cardiovascular disorder; fibronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                                                                   Proteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at least one of these T cell epitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for the immunogenic within an enzymatic activity which has a beneficial therapeutic effect, a protein used to convert inactive drugs to its active form within a living organism. The method can be used so a carrier of other molecule or a protein which binds to other molecules or carrier of other molecules within or introduced within the living organism in order to alter the bio distribution of other molecules, such that the protein does not strinulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a certain strains of beta-haemolytic streptococi: The protein has no certain strains of beta-haemolytic streptococi: The protein has no certain strains of beta-haemolytic streptococi: The protein has no certain strains of beta-haemolytic streptococi: Streptokinase is considerable clinical importance owing to its ability to efficiently bind human plasminogen, considerable clinical importance of fibrin filaments in blood clots. Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, myocardial infarction. The native protein is immunogenic and the protein to a single use. The netwood protein a longer correptokinase. The streptokinase sequence of the wild type streptokinase. The streptokinase sequence is given in AAB01296. See GENESEQ records AAB01289-B01302.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ÷
                                                                                                                                                                                                                                                                                                     Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Proteins or their fragments can be rendered non-immunogenic or less immunogenic by identifying one or more potential T cell epitopes and modifying the sequence to eliminate at lesst one of these T cell epitopes to reduce the immunogenicity of the protein when exposed to the immune system of another organism. The method can be used for producing a protein with an enzymatic activity which has a beneficial therapeutic effect, a protein used to convert inactive duugs to its active form within a living organism, a vaccine, a protein used as a carrier of other molecule or a protein which binds to other molecules within the living organism in order to alter the bio distribution of other molecules, such that the protein does not stimulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a timulate immune response in the living organism. The less immunogenic protein is useful in medicine, diagnosis and in manufacture of a certain strains of beca-haemolytic streptochiase is produced by contracting its activity but has considerable clinical importance of insolution of fibrin filaments in blood clots. Streptokinase is an dissolution of fibrin filaments in blood clots. Streptokinase is an effective thrombolytic agent in the treatment of coronary thrombosis, improving survival and preserving left ventricular function following production of neutralising antibodies in humans generally limits the correct or a simple was man man manufacture of a longer or more in the manufacture of a longer or more in the manufacture of a longer or more in the limit and manufacture of a longer or more in the limit and manufacture or and manufacture or and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
Rendering a protein non-immunogenic or less immunogenic useful in medicine and in diagnostics involves determining the amino acid sequence of the protein, identifying and modifying potential epitopes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of the altered streptokinase. The wild type streptokinase sequence

The present invention describes a method to create mutants of streptokinase (SK) which become more resistant to hydrolytic inactivation by human plasmin (HPIM) and more effective in activation of chuman plasmin (HPIM) and more effective in activation of chuman plasmin (HPIM) than the native SK that is commercially available. The novel HPIM hydrolysis resistant SK can be created by the near the peptide bonds that are hydrolysed by HPIM. The mutant SK can be used to form HPID and native SK and could be used as a thrombolytic agent. The mutant SK sequence could be coupled with other proteins to form fusion proteins and improve the fibrinolytic activity of the fusion proteins. Some truncated SKs such as SKIG-378) could activate HPIG as efficiently as native SK. The truncated SKs comprising the modification of ProS8-LysSS-Ser60-Lys61 to other amino acids would have a better thrombolytic activity than the corresponding native truncated SK. Since LysS9-Ser60 is among the few peptide bonds which are cleaved in the early reaction with HPIM and the MR2-terminal peptide chain of 11e1-LysS9 is essential in stabilising the structure of SK, the mutation at for near by the peptide bond and might improve the stability of the hydrolysis of the peptide bond and might improve the stability of streptokinase (KS9E) given in the present sequence represents the mutant streptokinase (KS9E) given in the present invention.

N.B. The present sequence corresponds to the indexers best interpretation of thin print.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preparation of novel streptokinase mutants as improved thrombolytic
                                                                                                                                                                                                                         Misc-difference 370

The present sequence is streptokinase, a single-peptide secretory protein which is produced by various strains of haemolytic Streptococcus. Streptokinase forms a tight binding complex with human plasminogen, causing the spontaneous conversion of plasminogen to its active form, plasmin. Plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Plasmin is implicated in pericellular proteolysis associated with a wide range of physiological and pathological processes. Plasminogen activators regulate plasminogen expression either by forming a binding complex, as in the case of streptokinase, or by hydrolysing a peptide bond in plasminogen to convert it to plasmin. Review of sequence homologies of several plasminogen citrators and chymotrypsin has identified a six amino acid peptide in citrators and chymotrypsin has identified is particularly useful when inserted between amino acid residues 644 and 645 of full length chuman plasminogen. Novel plasminogen activators have been made based upon chuman plasminogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·.

Streptokinase produced using E.coli transformed with a recombinant streptokinase vector can be isolated for use as a thrombolytic agent to facilitate the in vivo lysis or dissolution of blood clots. The vector is esp. a plasmid obtd. from E.coli, esp. plasmid pBR 322. Recombinant plasmid pMF1 as defined by a restriction endonuclease map is claimed. Escherichia coli HB 101 harbouring plasmid pMF1 is deposited as ATCC 39613.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptokinase A; recombinant phage; thrombolytic agent; plasminogen;
                                                                                                                                                                                                                                                                                                                                                                       Streptokinase prodn. - by cultivating Escherichia coli ATCC 39613 contg. recombinant plasmid pMF1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  High yield streptokinase A prodn. from infected bacteria - contg. recombinant phage including gene from Streptococcus, useful as thrombolytic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100.0%; Score 30; DB 6; Length 440; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel thrombolytic agent comprising streptokinase where at least one nonessential portion has been modified. The invention also describes a method of forming a thrombolytic agent comprising determining a nonessential portion of streptokinase and modifying the nonessential portion to render the resulting protein less antigenic. The modified streptokinase is used to treat blood clot disorders, such as heart attacks. The modified streptokinase has less antigenicity than streptokinase but is still able to complex plasminogen and lead to plasminogen activation. Modified streptokinase with the smaller proteins are cheaper and easier to produce. This sequence represents a fragment of a Streptococcus sp. streptokinase protein which is used in the description of the method of the invention.
                                                                                                              Thrombolytic agent; streptokinase; antigenic; blood clot; heart attack;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New thrombolytic agents derived from modified humanized streptokinase, useful for treating blood clot disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò

                                                                                                                                                                      ·.
        Lambda L47.1 is ligated with genomic DNA from S. pyogenes SF130/13 and the resultant product used to transform bacteria. Infected cells are cultured in liq. medium contga assimilable C and N sources, and streptokinase A is isolated from the cell lysate. The infected cells provide the protein in high yields, i.e. 1000 U/ml compared to 80 U/m; for the donor strain. The protein activates the autocatalytic conversion of human plasmin, so is potentially useful as a thronbolytic agent. See also DD 276693 (AAQ05603).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plasmid pMW1 (contg. the streptokinase G gene ) is ligated with pUC19 and the resultant product used to transform bacteria. Infected cells are cultured in 1iq. medium contg. assimilable C and N sources, and streptokinase G is isolated from the cell lysate.

The infected cells provide the protein in high yields, i.e. 600 U/ml which is 1.5-2 times that for the donor strain. The protein activates the autocatalytic conversion of human plasmin, so is potentially useful as a thronbolytic agent. See also DD-276634 (AAQ05664).

The sequence was deduced from PCR amplified chromosomal DNA from S. equisimilis (Lancefield's Gp C ) Arcc 10009 or Arcc 9642. The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). See Swiss-Prot K02986 and P00779 and Geneseq N70106. The gene can be used to construct expression vectors in which the streptokinase gene is linked to a second gene encoding e.g. another streptokinase protein, hirdin, or a streptokinase-like protein, via a linking sequence encoding a cleavage site for e.g. factor Xa or thrombin. The enzymes which cleave the fusion protein are present at the site of the target thrombus so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the active agents are released specifically at the place where clot formation is occurring.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protein
```

```
The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5481 sequences (31), given in the specification. The proteins have antibacterial and antiinflammatory activity. [1], nucleic acids encoding (1), ABN6604-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly 8. agalactiae and 8. pyrogenes. Nucleic acids encoding (1) are used to detect Streptococcus in a streptococcus from ample: (1) is used to determine whether a compound binds to (1). A composition comprising (1) or a nucleic acid encoding (1), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be used in gene therapy. Antibodies to (1) are used for affinity contactors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein -

```

```
The protein is a recombinant product of a gene fusion construct.

The sequence of the synthetic hirudin HV-1 genes was designed based on the published manno acid sequence (bodt J., et al FEBS Letters 165 180 (1984)). The sequence of streptokinase was obtd.

From PCR amplified chromosomal DNA from S. equisimilis ATCC 10009 or ATCC 9642. The primers used for the PCR were based on the published DNA sequence of S. equisimilis strain H46A (Malke, H., Roe, B., and Ferretti, J.J., Gene 34 357-362 [1985]). The two sequences were used to construct an expression vector in which the hirudin gene is linked to the streptokinase gene via a linking sequence encoding a cleavage site for factor Xa. The factor Xa is present at the site of the target thrombus so the active agents are released specifically at the place where clot formation is occurring. See also AAR12887-R12889, AAR12891-R12894 and AAR12522.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1,

Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUWANNI FOR DIAGNOSTICS AND THERAPBUTICS
FILE REFERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 7836
LENGTH: 626
LENGTH: 626
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 4507, Application US/09328352
